

Where Strong Authentication meets IDAM

As the security landscape is changing, so are the business challenges that organizations are facing. With data breaches and information theft on the rise, it is becoming even more crucial to protect your data from unwanted third parties.

emAS is a multifactor authentication system that supports 17+ modes of authentication with multi-factor auth. capability based on risk parameters.

Some of the key features include:

- Ability to define access at granular levels (page, button, folder)
- Support for OTP, Digital Signatures and FIDO
- Support for SAML/OAUTH for Single Sign On

emAS is the single point for managing identities and access across applications both on-premise and on the cloud and used by over 40 banks globally.
